Initial data collection report

The University provided dataset from 7 runs of an online cyber-security course. The data provided was in csv format. The data concerned the following areas:

- User activity;
- User personality archetypes;
- User enrollment;
- Leaving survey responses;
- Assessment data;
- Team members; and
- Video statistics.

This data was supported by 7 PDF documents, each providing further information about a particular run of the course (start and end dates, information about each 'step' of the course, etc.).

N.B. Because this data was provided directly by the University there is no description of the data's background, sources (systems), method of extraction, etc.
